Divide-and-Conquer

1

Divide-and-Conquer

- ◆ **Divide-and conquer** is a general algorithm design paradigm:
 - **Divide**: divide the input data S in two or more disjoint subsets S_1, S_2, \dots
 - **Recur**: solve the subproblems recursively
 - **Conquer**: combine the solutions for S_1, S_2, \dots into a solution for S
- ◆ The base case for the recursion are subproblems of constant size
- ◆ Analysis can be done using **recurrence equations**

© 2013 Goodrich, Tamassia, Goldwasser

Divide-and-Conquer

2

Merge-Sort Review

- ◆ Merge-sort on an input sequence S with n elements consists of three steps:
 - **Divide**: partition S into two sequences S_1 and S_2 of about $n/2$ elements each
 - **Recur**: recursively sort S_1 and S_2
 - **Conquer**: merge S_1 and S_2 into a unique sorted sequence

Algorithm *mergeSort*(S)

Input sequence S with n elements

Output sequence S sorted according to C

if $S.size() > 1$

$(S_1, S_2) \leftarrow partition(S, n/2)$

$mergeSort(S_1)$

$mergeSort(S_2)$

$S \leftarrow merge(S_1, S_2)$

3

Recurrence Equation Analysis

- ◆ The conquer step of merge-sort consists of merging two sorted sequences, each with $n/2$ elements and implemented by means of a doubly linked list, takes at most bn steps, for some constant b .
- ◆ Likewise, the basis case ($n < 2$) will take at b most steps.
- ◆ Therefore, if we let $T(n)$ denote the running time of merge-sort:

$$T(n) = \begin{cases} b & \text{if } n < 2 \\ 2T(n/2) + bn & \text{if } n \geq 2 \end{cases}$$

- ◆ We can therefore analyze the running time of merge-sort by finding a **closed form solution** to the above equation.
 - That is, a solution that has $T(n)$ only on the left-hand side.

Divide-and-Conquer

4

Iterative Substitution

- In the iterative substitution, or “plug-and-chug,” technique, we iteratively apply the recurrence equation to itself and see if we can find a pattern:
$$\begin{aligned}T(n) &= 2T(n/2) + bn \\&= 2(2T(n/2^2)) + b(n/2) + bn \\&= 2^2T(n/2^2) + 2bn \\&= 2^3T(n/2^3) + 3bn \\&= 2^4T(n/2^4) + 4bn \\&= \dots \\&= 2^iT(n/2^i) + ibn\end{aligned}$$
- Note that base, $T(n)=b$, case occurs when $2^i=n$. That is, $i = \log n$.
- So,
$$T(n) = bn + bn \log n$$
- Thus, $T(n)$ is $O(n \log n)$.

Divide-and-Conquer

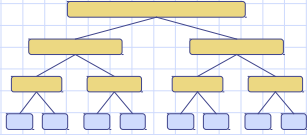

5

The Recursion Tree

- Draw the recursion tree for the recurrence relation and look for a pattern:
$$T(n) = \begin{cases} b & \text{if } n < 2 \\ 2T(n/2) + bn & \text{if } n \geq 2 \end{cases}$$

depth	T's	size	time
0	1	n	bn
1	2	$n/2$	bn
i	2^i	$n/2^i$	bn
...

Total time = $bn + bn \log n$
(last level plus all previous levels)

Divide-and-Conquer

6

Guess-and-Test Method

- In the guess-and-test method, we guess a closed form solution and then try to prove it is true by induction:
$$T(n) = \begin{cases} b & \text{if } n < 2 \\ 2T(n/2) + bn \log n & \text{if } n \geq 2 \end{cases}$$
- Guess: $T(n) < cn \log n$.
$$\begin{aligned}T(n) &= 2T(n/2) + bn \log n \\&= 2(c(n/2) \log(n/2)) + bn \log n \\&= cn(\log n - \log 2) + bn \log n \\&= cn \log n - cn + bn \log n\end{aligned}$$
- Wrong: we cannot make this last line be less than $cn \log n$

© 2013 Goodrich, Tamassia, Goldwasser

Divide-and-Conquer

7

Guess-and-Test Method, (cont.)

- Recall the recurrence equation:
$$T(n) = \begin{cases} b & \text{if } n < 2 \\ 2T(n/2) + bn \log n & \text{if } n \geq 2 \end{cases}$$
- Guess #2: $T(n) < cn \log^2 n$.
$$\begin{aligned}T(n) &= 2T(n/2) + bn \log n \\&= 2(c(n/2) \log^2(n/2)) + bn \log n \\&= cn(\log n - \log 2)^2 + bn \log n \\&= cn \log^2 n - 2cn \log n + cn + bn \log n \\&\leq cn \log^2 n\end{aligned}$$
 - if $c > b$.
- So, $T(n)$ is $O(n \log^2 n)$.
- In general, to use this method, you need to have a good guess and you need to be good at induction proofs.

Divide-and-Conquer

8

Master Method (Appendix)

◆ Many divide-and-conquer recurrence equations have the form:

$$T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$, provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

Master Method, Example 1

◆ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$, provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

◆ Example: $T(n) = 4T(n/2) + n$

Solution: $\log_b a = 2$, so case 1 says $T(n)$ is $O(n^2)$.

© 2013 Goodrich, Tamassia, Goldwasser Divide-and-Conquer 10

Master Method, Example 2

◆ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$, provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

◆ Example: $T(n) = 2T(n/2) + n \log n$

Solution: $\log_b a = 1$, so case 2 says $T(n)$ is $O(n \log^2 n)$.

© 2013 Goodrich, Tamassia, Goldwasser Divide-and-Conquer 11

Master Method, Example 3

◆ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$, provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

◆ Example: $T(n) = T(n/3) + n \log n$

Solution: $\log_b a = 0$, so case 3 says $T(n)$ is $O(n \log n)$.

© 2013 Goodrich, Tamassia, Goldwasser Divide-and-Conquer 12

Master Method, Example 4

◆ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$,
provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

◆ Example:

$$T(n) = 8T(n/2) + n^2$$

Solution: $\log_b a = 3$, so case 1 says $T(n)$ is $O(n^3)$.

Master Method, Example 5

◆ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$,
provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

◆ Example:

$$T(n) = 9T(n/3) + n^3$$

Solution: $\log_b a = 2$, so case 3 says $T(n)$ is $O(n^3)$.

Master Method, Example 6

◆ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

◆ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$,
provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

✧ Example:

$$T(n) = T(n/2) + 1 \quad (\text{binary search})$$

Solution: $\log_b a = 0$, so case 2 says $T(n)$ is $O(\log n)$.

Master Method, Example 7

✧ The form: $T(n) = \begin{cases} c & \text{if } n < d \\ aT(n/b) + f(n) & \text{if } n \geq d \end{cases}$

✧ The Master Theorem:

1. if $f(n)$ is $O(n^{\log_b a - \epsilon})$, then $T(n)$ is $\Theta(n^{\log_b a})$
2. if $f(n)$ is $\Theta(n^{\log_b a} \log^k n)$, then $T(n)$ is $\Theta(n^{\log_b a} \log^{k+1} n)$
3. if $f(n)$ is $\Omega(n^{\log_b a + \epsilon})$, then $T(n)$ is $\Theta(f(n))$,
provided $af(n/b) \leq \delta f(n)$ for some $\delta < 1$.

✧ Example:

$$T(n) = 2T(n/2) + \log n \quad (\text{heap construction})$$

Solution: $\log_b a = 1$, so case 1 says $T(n)$ is $O(n)$.

Iterative "Proof" of the Master Theorem

✂ Using iterative substitution, let us see if we can find a pattern:

$$\begin{aligned} T(n) &= aT(n/b) + f(n) \\ &= a(aT(n/b^2)) + f(n/b) + bn \\ &= a^2T(n/b^2) + af(n/b) + f(n) \\ &= a^3T(n/b^3) + a^2f(n/b^2) + af(n/b) + f(n) \\ &= \dots \\ &= a^{\log_b n} T(1) + \sum_{i=0}^{(\log_b n)-1} a^i f(n/b^i) \\ &= n^{\log_b a} T(1) + \sum_{i=0}^{(\log_b n)-1} a^i f(n/b^i) \end{aligned}$$

✂ We then distinguish the three cases as

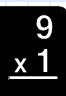

- The first term is dominant
- Each part of the summation is equally dominant
- The summation is a geometric series

Divide-and-Conquer

17

Integer Multiplication

✂ Algorithm: Multiply two n-bit integers I and J.

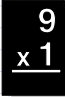

- Divide step: Split I and J into high-order and low-order bits
$$I = I_h 2^{n/2} + I_l$$
$$J = J_h 2^{n/2} + J_l$$
- We can then define I*J by multiplying the parts and adding:
$$I * J = (I_h 2^{n/2} + I_l) * (J_h 2^{n/2} + J_l)$$
$$= I_h J_h 2^n + I_h J_l 2^{n/2} + I_l J_h 2^{n/2} + I_l J_l$$
- So, T(n) = 4T(n/2) + n, which implies T(n) is O(n²).
- But that is no better than the algorithm we learned in grade school.

© 2013 Goodrich, Tamassia, Goldwasser

Divide-and-Conquer

18

An Improved Integer Multiplication Algorithm

✂ Algorithm: Multiply two n-bit integers I and J.

- Divide step: Split I and J into high-order and low-order bits
$$I = I_h 2^{n/2} + I_l$$
$$J = J_h 2^{n/2} + J_l$$
- Observe that there is a different way to multiply parts:
$$I * J = I_h J_h 2^n + [(I_h - I_l)(J_l - J_h) + I_h J_h + I_l J_l] 2^{n/2} + I_l J_l$$
$$= I_h J_h 2^n + [(I_h J_l - I_l J_l - I_h J_h + I_l J_h) + I_h J_h + I_l J_l] 2^{n/2} + I_l J_l$$
$$= I_h J_h 2^n + (I_h J_l + I_l J_h) 2^{n/2} + I_l J_l$$
- So, T(n) = 3T(n/2) + n, which implies T(n) is O(n^{log₂3}), by the Master Theorem.
- Thus, T(n) is O(n^{1.585}).
